

Gradescope Autograder Tips

When you submit homework to Gradescope, please follow the tips below

Wait for the autograder to finish running before leaving the page

 The autograder hasn't finished running yet.

The online tests you pass might not run exactly like they do on your computer. When the autograder finishes, you will see a list of the tests your code failed. You have the opportunity to resubmit your code an unlimited number of times before the deadline.

The autograder will display one of 4 messages after it finishes:

1. **Your submission has been successfully graded.**
Your code runs, but this does not necessarily mean you passed all the tests.
2. **We were unable to locate one or more files. Please make sure you have uploaded all required .java files and the first line of each file begins with “package”.**
You have not uploaded all required .java files to Gradescope, or you have uploaded an improperly formatted file. Make sure to upload every file you edit for an assignment and leave the first line of each file intact.
3. **Your submission timed out.**
It took longer than 10 minutes to run your code, which usually means there is an infinite loop. If you cannot determine where the problem occurred, contact a TA or instructor for help.
4. **The autograder failed to execute correctly.**
There was a different problem with your code. Make sure your code compiles on your computer and resubmit. If your code works on your computer, please contact a TA or instructor for help.

You will receive an email from Gradescope once your code is submitted

If you don't get this email, the graders will not be able to see your code.
